DECLARATION

We hereby declare that the project report entitled "**Blockchain for Good Governance**" submitted by us to the Tribhuvan University, Thapathali Campus during the academic year 2022-23 in partial fulfillment of the requirements for award of Degree, Bachelor of Engineering in Electronics Communication and Information is a record of debonair project work carried out by us under the guidance and supervision of . We further declare that the work reported in this project has not been submitted and will not be , either in part or full, for the award of any other degree or diploma in this institute or any other University.

CONTENTS

ACKNOWLEDGEMENT

Many noble hearts contributed immense inspiration and support for the successful completion of the project. We are unable to express our gratitude in words to such individuals.

The authors would like to express their gratitude to their supervisor, Dr. Jane Doe, for her invaluable guidance and support throughout this project. They would also like to thank their colleagues and friends for their help and encouragement. In addition, they would like to acknowledge the funding agency, XYZ Foundation, for their financial support and the use of their facilities. Finally, the authors would like to thank the participants who generously gave their time and effort to this research. Their contributions were invaluable and greatly appreciated.

We will be failing in duty if we do not acknowledge with grateful thanks to the authors of references and other literatures referred in this project.

Last, but not the least, We take pleasant privilege in expressing our heartfelt thanks to our friends who were of precious help in completing this project.

Krishna Acharya (THA078BEI020)

ABSTRACT

The purpose of this study was to investigate the effects of exercise on cognitive function in older adults. A randomized controlled trial was conducted with 100 participants aged 65 and over, who were assigned to either a control group or an exercise group. The participated in a supervised aerobic and resistance training program three times per week for 12 weeks, while the control group did not participate in any structured exercise. Cognitive function was measured using a battery of standard parapsychologist tests at baseline and after the intervention. Results showed that the exercise group had significantly improved scores on measures of executive function, processing speed, and working memory compared to the control group. These findings suggest that regular exercise may have a positive impact on cognitive function in older adults.
